

Noreon MVP Product Experience Brief

Upload-ready instructions for an AI builder / vibe-coding service

Field	Instruction
Product name	Noreon
Website/domain	noreonhealth.com or noreon.health, depending final choice
AI assistant temporary name	Zoe
MVP purpose	Create an internal MVP for the founding team to try the full product experience on themselves before external launch.
Primary experience	A caring chat-first preventive health coach that guides onboarding, daily routine, biomarker test booking simulation, food-photo guidance, daily missions, weekly missions, and doctor-reviewed report simulation.
Important positioning	Doctor-monitored preventive health platform. Zoe supports and explains, but does not replace doctors.

1. Instruction to the AI Builder

Build a clickable and functional internal MVP of Noreon focused on the complete user experience. The MVP does not need full production medical operations. It should simulate or manually support complex parts where needed, but the user journey should feel real enough for the founding team to test daily.

Do not over-focus on technical architecture. Focus on screens, flows, user behavior, coaching mechanics, daily routines, mission systems, and the emotional experience of using the product.

2. Product Concept

Noreon is a doctor-monitored preventive medicine and longevity platform. It helps users create a biological and lifestyle profile, schedule a biomarker blood test, receive a doctor-reviewed insight report, and stay active daily through Zoe, a caring professional health coach.

3. Core MVP Experience

1. User opens Noreon and understands the promise: a new era of preventive health.
2. User creates a health profile through smooth conversational onboarding.
3. User receives temporary access to Zoe before payment or full biomarker testing.
4. Zoe creates a starter daily routine from user inputs.
5. User sees daily missions, weekly missions, streaks/rhythm tracking, and food-photo guidance.
6. User can simulate booking a biomarker blood test at their location.
7. User can see a sample doctor-reviewed biomarker report.
8. Zoe explains report insights and turns them into daily actions.
9. User continues using the app daily for walking, sleep, food, exercise, and stress habits.

4. Experience Principles

- Start with value, not payment. The user should receive a starter routine and temporary Zoe access before the biomarker booking conversion.
- Make the app feel caring, scientific, premium, and non-judgmental.
- The interface should be built around Zoe chat, not around a static dashboard.
- Health goals should feel achievable. Avoid overwhelming the user with too many actions.
- Gamification should build momentum without shame. Missed days should trigger recovery coaching, not punishment.
- Biomarker insights should be described as doctor-reviewed. Zoe should not diagnose disease.
- Sensitive wellbeing, hormonal balance, reproductive health, energy, mood, libido, and fertility should be treated as part of overall health, not as a separate product vertical.

5. Main MVP Screens

Screen	Purpose	Key elements
Welcome	Introducing Noreon.	Headline, promise, Start button, How it works.
How It Works	Set expectations.	1) Build profile, 2) Get starter routine, 3) Book biomarker test, 4) Doctor-reviewed insights.
Onboarding Chat	Collect user data smoothly.	Zoe asks short questions using cards, sliders, multi-select, and optional free text.
Data Completeness	Show progress.	Profile % complete, missing data, biomarker test unlock explanation.
Starter Routine	Give value before payment.	Morning, food, walking, exercise, sleep, stress plan.
Zoe Chat Home	Main daily interface.	Conversation, daily briefing, Ask Zoe input, daily missions.
Daily Missions	Drive daily action.	Food, walk, sleep, exercise, hydration, stress missions.
Weekly Missions	Create a weekly progress loop.	Weekly focus, progress bars, mission checklist.
Food Photo	Enable meal guidance.	Camera/upload, meal interpretation, what to eat/reduce/add.
Exercise Plan	Provide movement guidance.	Beginner-friendly plans, walking, mobility, strength, recovery.
Biomarker Test	Show test package and booking flow.	Recommended package, included markers, schedule, location, preparation.
Test Tracker	Simulate operations.	Scheduled, collector assigned, collected, lab processing, doctor review, report ready.
Report	Show doctor-reviewed insights.	Summary, risk signals, biomarker categories, lifestyle recommendations.
Profile	User controls.	Health profile, goals, privacy, notification preferences.

6. Smooth Onboarding Flow

The onboarding must collect a lot of information, but it should feel conversational and useful. Zoe should explain why each section matters.

Step	Experience
1. Welcome	Show Noreon promise and start button.

2. Goals	User selects 3-5 goals: energy, sleep, metabolism, longevity, weight, stress, heart health, hormonal balance, reproductive goals, food habits.
3. Basic profile	Age, sex assigned at birth, height, weight, city, work schedule.
4. Medical background	Known conditions, medications, allergies, current supplements, previous diagnoses.
5. Family history	Diabetes, heart disease, cancer, thyroid, autoimmune, fertility/hormonal issues.
6. Lifestyle rhythm	Wake time, bedtime, work hours, sitting time, meal timing, activity baseline.
7. Nutrition	Diet style, restrictions, allergies, cravings, eating out, snacking, main nutrition challenge.
8. Sleep and recovery	Sleep duration, quality, consistency, caffeine timing, screen use, night awakenings.
9. Movement	Current exercise, step baseline, limitations, preferred activities, gym/home access.
10. Stress and motivation	Stress level, main barrier, preferred coaching style, reminder preferences.
11. Sensitive wellbeing optional	Energy, mood, hormones, libido, fertility, cycle/menopause/performance concerns as optional overall-health inputs.
12. Data completeness	Show what is complete and what biomarker testing will improve.
13. Starter routine	Zoe generates first routine from current inputs.
14. Temporary Zoe access	Allow limited chat and sample food-photo guidance before payment.
15. Biomarker test recommendation	Show recommended package and booking CTA.

7. Temporary Zoe Access Before Payment

The user should feel the product value before being asked to pay or book biomarker testing.

- Give user a starter daily routine immediately after onboarding.
- Allow 3-5 free Zoe questions.
- Allow 1-2 food photo tests.
- Show basic daily missions.
- Explain that full personalization and doctor-reviewed insights require biomarker testing.
- Do not show medical risk conclusions before biomarker test and doctor review.

8. Zoe Personality and Chat Instructions

Dimension	Instruction
Role	Zoe is a caring professional health coach inside a doctor-monitored platform. Zoe supports, explains, motivates, and helps the user stay consistent.
Tone	Warm, calm, respectful, intelligent, practical, non-judgmental.
Never do	Do not diagnose disease. Do not frighten users. Do not shame users. Do not pretend to be a doctor. Do not give strong medical conclusions without doctor-reviewed report.
Always do	Acknowledge the user, explain briefly, recommend one achievable action, and reduce psychological pressure.
Daily style	Short, supportive, specific. Zoe should give one or two priorities, not ten.
Missed goals	Frame as recovery, not failure.
Biomarkers	Explain doctor-reviewed findings in plain language and connect to daily actions.

Sensitive topics	Handle energy, hormones, reproductive health, libido, cycle, fertility, and performance as part of overall health, with privacy and maturity.
------------------	---

9. Zoe Response Mechanics

Use this response structure for most Zoe coaching replies:

1. Acknowledge: recognize the user’s situation or emotion.
2. Personalize: refer to their goals, habits, or available profile data.
3. Explain: give a short reason why it matters.
4. Action: recommend one clear next step.
5. Encourage: reduce guilt and create momentum.

Example after missed walk:

“You missed yesterday’s walk, but that does not erase your progress. Since your goal is better metabolic rhythm, let’s make today easier: take a 12-minute walk after lunch. Small recovery actions matter.”

Example after poor meal:

“This meal is higher in refined carbohydrates than ideal for your current goals. No need to compensate harshly. For your next meal, add protein and vegetables first, and take a short walk afterward.”

10. Daily Home Experience

The home screen should be chat-first. It should feel like Zoe is checking in and guiding the user’s day.

- Top: friendly Zoe greeting and daily focus.
- Main: chat panel with “Ask Zoe anything about today’s routine.”
- Daily missions card with 2-4 tasks.
- Food photo button.
- Walking/sleep/exercise progress cards.
- Weekly mission progress.
- Biomarker test CTA if not booked.
- Report CTA if report is ready.

11. Daily Mission System

Daily missions should be small, achievable, and personalized. The user should feel progress every day.

Mission type	Examples	Zoe guidance
Food	Photograph lunch; add protein to breakfast; reduce sugary drink; add vegetables to dinner.	“Let’s make one meal more balanced today, not your whole diet perfect.”
Walking	Walk 15 minutes after lunch; reach 6,000 steps; take 5-minute work break walk.	“A short walk after meals can support metabolic health.”
Sleep	Start wind-down 30 minutes before bed; avoid caffeine after 3 PM; put phone away 20 minutes before sleep.	“Tonight’s goal is consistency, not perfect sleep.”

Exercise	10-minute mobility; beginner strength session; 2 sets of squats and push movements.	"We will build strength gently. Stop if you feel pain."
Hydration	Drink water after waking; replace one sweet drink; 6 glasses target.	"Hydration supports energy and appetite regulation."
Stress	3-minute breathing; screen-free break; short walk outside.	"Reducing pressure is part of health, not a luxury."
Test preparation	Confirm appointment; fasting reminder; hydration reminder; prepare address/contact.	"Your test is tomorrow. I'll help you prepare clearly."

12. Weekly Mission System

- Each week has one main focus such as Metabolic Rhythm, Better Sleep, Energy Reset, Movement Foundation, Stress Recovery, or Biomarker Readiness.
- Weekly missions should include 3-5 goals, not more.
- Completion target should be 60-80%, not 100%, to avoid perfection pressure.
- Zoe should summarize weekly progress every Sunday or chosen review day.

Weekly focus	Weekly missions
Metabolic Rhythm	4 food photos, 5 after-meal walks, 3 protein-based breakfasts, reduce sugary drinks 4 days.
Sleep Consistency	4 nights of planned bedtime, 3 wind-down sessions, no caffeine after 3 PM on 4 days.
Movement Foundation	2 strength sessions, 4 walking goals, 2 mobility sessions.
Stress Recovery	4 breathing exercises, 2 outdoor walks, 1 screen-free evening block.
Biomarker Readiness	Complete profile, confirm appointment, follow fasting rules, review preparation tips.

13. Streaks and Rhythm Mechanics

Use "rhythm" language if "streak" feels too playful. The goal is consistency without shame.

- Track daily check-in rhythm.
- Track food-photo rhythm.
- Track walking rhythm.
- Track sleep wind-down rhythm.
- Allow one grace day per week.
- If a streak is missed, show "Recovery Win" when the user returns.
- Do not show harsh failure states.

Mechanic	Rule
Grace day	One missed day per week does not break the rhythm.
Recovery win	If user returns after missed day, celebrate restart.
Weekly consistency	Show percentage completion instead of only streak count.
Gentle badges	Use mature badges: Routine Started, Sleep Rhythm, Food Awareness, Biomarker Ready, Recovery Win.

14. Exercise Plan Mechanics

Exercise plans should be simple, safe, and adjustable based on user baseline. The MVP should include beginner, intermediate, and low-energy options.

Plan level	Weekly structure	Example sessions
Beginner	2 strength/mobility sessions + 4 walking missions.	10 min mobility; 15 min walk after meals; simple bodyweight routine.
Intermediate	2-3 strength sessions + 2 cardio sessions + walking.	30 min strength; 20 min zone 2 cardio; mobility recovery.
Low-energy / stressed	Very small recovery actions.	5 min walk; breathing; stretching; earlier bedtime.
Metabolic focus	After-meal walks + strength twice weekly.	10-20 min post-meal walk; lower-body strength; light cardio.
Sleep focus	Movement earlier in day, calming routine evening.	Morning walk; light mobility; no intense late exercise.

15. Example Exercise Sessions

Session	Structure
10-minute mobility	Neck rolls, shoulder circles, hip circles, hamstring stretch, cat-cow, gentle breathing.
Beginner strength 1	Bodyweight squats 2x8, wall pushups 2x8, glute bridges 2x10, plank 2x20 sec.
Beginner strength 2	Step-ups 2x8 each side, incline pushups 2x8, dead bug 2x8, side plank 2x15 sec.
Metabolic walk	10-20 minutes after lunch or dinner, comfortable pace.
Recovery evening	5 minutes slow breathing, 5 minutes stretching, screen reduction.

Zoe safety wording: “This is general wellness guidance. If you have pain, dizziness, chest discomfort, or medical restrictions, stop and consult a doctor.”

16. Food Photo Experience

Food photo guidance is one of the strongest daily engagement mechanics. It should be fast and supportive.

1. User taps “Photograph meal.”
2. User uploads or captures image.
3. App identifies likely foods and asks user to confirm if needed.
4. Zoe gives meal feedback based on user profile.
5. Zoe explains what is good, what to reduce, and what to add.
6. Meal contributes to daily nutrition mission and weekly pattern.

Feedback category	Example
Good in this meal	Good protein source; vegetables included; moderate portion.
Watch area	High refined carbohydrates; low fiber; sugary drink included.
Suggested improvement	Add protein, reduce bread/rice portion, add salad, replace soda with water.
Personalized reason	Because your goal is better metabolic rhythm, this meal may be improved by balancing carbohydrates with protein and fiber.

17. Helpful Tips Library

The MVP should include a library of short helpful tips that Zoe can use in chat, missions, and daily briefings.

Category	Helpful tips
Food	Start with protein at breakfast; add fiber to carbohydrate-heavy meals; avoid drinking calories daily; do not skip meals to punish yourself; use smaller portions rather than total restriction.
Walking	After-meal walks are useful; 10 minutes is enough to start; walking during calls counts; consistency beats intensity.
Sleep	Consistent bedtime matters; caffeine timing affects sleep; phone light and work stress delay recovery; wind-down rituals help.
Exercise	Strength supports metabolic health; mobility protects consistency; low-energy days still count if you move gently.
Stress	Stress affects appetite, sleep, and recovery; short breaks matter; breathing exercises are not magic but can lower pressure.
Biomarkers	Biomarkers are signals, not identity; one result rarely tells the whole story; trends matter; doctor review matters.
Motivation	Missed days are normal; restart is a skill; smaller goals are better than abandoned perfect plans.

18. Biomarker Test Experience

1. Noreon recommends a first biomarker package based on onboarding.
2. User reviews what is included and why it matters.
3. User selects date, time, and location for blood collection.
4. Zoe sends preparation instructions and reminders.
5. App shows test tracker status.
6. Report is marked as doctor-reviewed before sensitive insights are shown.
7. Zoe explains the report and maps findings to daily actions.

19. Sample Biomarker Report Experience

- Show “Doctor-reviewed” badge clearly.
- Use calm risk wording: low, watch, medium risk pattern, doctor follow-up recommended.
- Avoid broad cancer-risk claims unless validated and reviewed. Use “additional evaluation may be recommended” wording.
- Connect each insight to daily behavior: food, walking, sleep, exercise, stress, retest timeline.

Report section	Content
Executive summary	Plain-language overview of current health signals.
Key insights	Doctor-reviewed findings, not too many at once.
Risk signals	Metabolic, cardiovascular, inflammation, hormonal/nutritional, kidney/liver where relevant.
What is strong	Positive markers to reinforce progress.
What needs attention	Watch areas and next steps.
Daily plan	Actions tied to findings.
Follow-up	Retest timing or doctor/specialist consultation when needed.

20. Integrated Sensitive Wellbeing

Do not create a separate “sexual health product.” Treat intimate wellbeing, libido, fertility, reproductive health, menopause, performance, hormones, energy, mood, and recovery as part of whole-person preventive health.

- This section is optional in onboarding.
- Use discreet, mature language.
- Allow users to skip without penalty.
- Do not diagnose infertility, STI, hormonal disorder, or sexual dysfunction.
- Zoe may explain that sleep, stress, metabolic health, medications, hormones, and emotional pressure can all affect intimate wellbeing.
- Doctor review is required for sensitive risk interpretations.

21. Payment and Booking Conversion

For the internal MVP, payment can be simulated. The experience should still show where payment will happen later.

- Do not ask for payment before onboarding and starter routine.
- Ask after user understands what biomarker testing unlocks.
- Conversion CTA: “Book my biomarker test.”
- Secondary CTA: “Continue with starter routine.”
- Show value included: at-home blood collection, lab processing, doctor-reviewed report, Zoe guidance based on biomarkers.

22. Internal MVP Admin/Doctor Experience

Because this MVP is for internal testing, complex operations can be manual or simulated, but the experience should exist.

- Admin can see users and onboarding completion.
- Admin can mark biomarker test as scheduled, collected, lab processing, doctor review, report ready.
- Admin/doctor can enter sample biomarker values.
- Doctor reviewer can approve or edit report insights.
- User sees report only after doctor-reviewed status is marked.

23. MVP Acceptance Criteria

- A user can complete onboarding without feeling like they are filling a long medical form.
- A user receives a personalized starter routine before payment.
- A user can chat with Zoe and receive helpful, emotionally intelligent coaching.
- A user can see daily missions, weekly missions, rhythm/streak status, and progress.
- A user can photograph or upload food and receive supportive meal feedback.
- A user can view exercise plans and complete daily movement missions.
- A user can simulate booking a biomarker test at their location.
- A user can see test status progress through report ready.
- A user can view a sample doctor-reviewed biomarker report.
- Zoe can explain report insights in plain language and map them to daily actions.
- Missed goals trigger supportive recovery messages, not failure messages.
- Sensitive wellbeing is integrated into overall health and remains optional/private.

24. Recommended Build Order for AI Builder

1. Create visual design direction and main navigation.
2. Build welcome and onboarding flow.
3. Build Zoe chat-first home screen.
4. Build starter daily routine generation screen.
5. Build daily missions, weekly missions, and rhythm/streak cards.
6. Build food photo upload and feedback flow.
7. Build exercise plan and walking/sleep goal screens.
8. Build biomarker test package and booking simulation.
9. Build test status tracker.
10. Build sample doctor-reviewed report.
11. Build admin/doctor review simulation.
12. Connect flows so founding team can test the full journey end to end.
